
raw logits z_A, z_B, z_C at a marker
softmax$(z/T + b)$ T and b fitted on the dev set
T alone does not change the ranking of sentences; the bias b restores the base rates of the classes
raw decision: $\arg\max(z_A, z_B, z_C)$
classification metrics (balanced accuracy, AUROC)
P(supported) $\geq \tau$?
yes
supported
no
P(contr.) > P(not ment.) ?
yes
contradicted
no
not mentioned
strict flag: every unsupported sentence
lenient flag: only contradicted ones
dashed box: calibrated probabilities, used for ECE, thresholds, selective prediction and the labels and flags returned by the API
